A; Title: The MYC protein activates transcription of the alpha-prothymosin gene.
A; Reference number: I53187; MUID:91114696
A; Reference number: I53187
A; Status: translated from GB/EMBL/DDBJ
A; Status: translated from GB/EMBL/DDBJ
A; Molecule type: mRNA
A; Residues: 1-112_CELL.
A; Cross-references: EMBL:X55326; NID:957661; PIDN:CAA39028.1; PID:957662
A; Experimental source: cell line RATIA
A; Rote: in GenBank entry RRPROTHYO, release 113.0, the source is designated as F; RHarites, A.A.; Blacher, R.; Stein, S.; Caldarella, J.; Horecker, B.L.
Proc. Natl. Acad. Sci. U.S.A. 82, 343-346, 1985
A; Ritle: Primary structure of rat thymus prothymosin alpha.
A; Reference number: A01519; MUID:85113197
A; Rocession: A01519
A; Molecule type: protein
A; Residues: 2-61, G', 63-64, BGGZZZZZZZZZZNV, 77-112 <HARL>
A; Note: it is possible that both Asp and Asn are present at positions 29 and 36
B; Haritos, A.A.; Goodall, G.J.; Horecker, B.L.

"Cloning and characterisation of a gene encoding the 11.5 kDa zinc-binding protein (parathymosin-alpha).";
FEBS Lett. 298:245-248(1992).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Biochem. Biophys. Res. Commun. 155:539-545(1988).
-!- FUNCTION: Parathymosin may mediate immune function by blocking the effect of prothymosin alpha which confers resistance to certain opportunistic infections.
                                                                                                                                                                                                                                                                                      MEDLINE-88239673; pubMed=3377505;

                                                        The productive tissues e.g. prostate, testis, fallopian tube, uterus and placenta, as well as in prostate cancer, testicular cancer and placenta, as well as in prostate cancer, testicular cancer and uterine cancer. This expression pattern makes it a target for diagnosis and for vaccine based therapy of such neoplasms.

An isolated PAGE-4 peptide which induces a cytotoxic T in tesponse when bound to a major histocompatibility complex. Immunogenic compositions to raise a cytotoxic T lymphocyte response immunogenic compositions to raise a cytotoxic T lymphocyte response immunogenic compositions to raise a cytotoxic T lymphocyte response against cells expressing PAGE-4 including cancer cells of the PAGE-4 peptide fragments can also be used in these compositions. Antibodies against PAGE-4 and its peptide fragments can be used in these compositions. Antibodies against PAGE-4 and its peptide fragments can be used in cells cancering the presence of PAGE-4 and PAGE-4 coding sequences in cell cancerous reproduction can be indicative of the spread of cancerous reproduction can be indicative of the spread of cancerous reproduction can be indicative of the spread of antibodies which are then used as the targeting group of immunoconjugates comprising toxins used in therapeutic applications. This has applications for drug delivery systems. The PAGE family of the profession of the control of th

The present sequence represents a GAGE-2 tumour tumour rejection antigen precursor (TRAP). The protein is expressed in a number of tumours. In contrast the only normal tissue which expresses GAGE TRAP protein is testis. Several GAGE TRAPS have been identified (see AAV18717-21). The major difference between these proteins and GAGE-1 is the absence of a stretch of 143 bases located at position 379 to 521 of the GAGE-1 TRAP sequence. The rest of the sequences show mismatches at various position, with the exception of GAGE-3 whose 5' end is totally different from the other GAGE cDNAs for the first 112 bases. This region of GAGE-3 cDNA contains a long repeat and a hairpin structure. The antigens can be used to diagnose melanomas, characterised by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; 5' EST; expressed sequence tag; secreted protein; cDNA isolation; gene therapy; chromosome mapping.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                1 MSWRGRSTYRPRPRRYVEPPEMIGPMRPEQFSDEVEPATPEEGEPATQRQDPAAAQEGED 60
                                                                                                                                                            Isolated nucleic acid encoding GAGE tumour rejection antigen precursor - processed by HLA-Cw6 molecules into peptides, useful to diagnose melanomas
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     expression of a TRAP or presentation of a tumour rejection antigen. Antigens shed into blood or urine can be observed and then used to confirm a diagnosis of melanoma using cytolytic T cell clone proliferation methodologies. Other uses for the processed peptides, include HLA-typing assays for, e.g. skin graft or organ transplants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              1 mswrgrstyrprrryveppemigpmrpeqfsdevepatpeegepatgrqdpaaaqeged 60

                                                                                                                                                                                                                                                                                                           ö
                                                                                     The present sequence is a polypeptide encoded by one of a large number of 5' ESTS derived from mRNAs encoding secreted proteins. The 5' ESTS were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTs are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer cDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTs are derived from mRNAs with intact 5' ends and can therefore be used to obtain full length cDNAs with intact 5' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design expression and secretion vectors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; nootropic; immunosuppressant; cytostatic; gene therapy; cancer; peripheral nervous system; neuropathy; central nervous system; CNS; Alzheimer's; Parkinson's disease; Huntington's disease; hamostatic; amyotrophic lateral sclerosis; Shy-Drager Syndrome; chemotactic; chemokinetic; thrombolytic; drug screening; arthritis; inflammation;
                    New nucleic acid that is a 5' expressed sequence tag (5' EST) for obtaining cDNAs and genomic DNAs that correspond to 5'ESTs and for diagnostic, forensic, gene therapy and chromosome mapping procedures

                                                                                                                                                                                                                                                                                                                                    The invention relates to human nucleic acids (AAIS7798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynocleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral nervous system diseases, such as localised neuropathies and central nervous system diseases, such as alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, cancer disquosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Note: The sequence data for this patent did not form part of the printed specification.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ò
                                                                                                                                                           The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PGR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags of ridentifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical inaging of sites expressing (II). (I) and (II) are useful for treating replypeptide and polynucleotide sequences have applications in disorders involving aberrant protein expression or biological activity.

The polypeptide and polynucleotide sequences have applications in claspnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      3;
                                                                                                                                                                                                                                                                                                                                                                                               and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention.

Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; nootropic; immunosuppressant; cytostatic; gene therapy; cancer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              peripheral nervous system; neuropathy; central nervous system; CNS; Alzhaimer's; Parkinson's disease; hademostatic; amyotrophic lateral sclerosis; Shy-Drager Syndrome; chemctactic; chemckinetic; thrombolytic; drug screening; arthritis; inflammation;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathies and central nervous system diseases, such as Alzheimer's parkinson's disease, Huntington's disease, such as lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, Activin/inhibin activity, chemotoctic/chemokinetic activity, nemeterclic/chemokinetic activity, nemeterclic/chemokinetic activity, nemeterclic/chemokinetic activity, amenostatic assays for receptor activity, arthritis and inflammation, leukaemias and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The sequence data for this patent did not form part of the printed

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ÷.
                                                                                                                                                                                                                                                                                                         The invention relates to polynucleotides (AAK51456-AAK53435) and the encoded polypeptides (AAM78323-AAM80302) that exhibit activity elating to cytokine. Cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, heamatopoiesis regulating activity issue growth factor activity, immunomodulatory activity and activity, infinibin activity and may be useful in the diagnosis and/or inflammation.
                                                                                                                                                                                      Υ;

proliferation proteins (CCYPR), which are encoded by AAF59543.

CCYPR and agonists of CCYPR are used to treat diseases or conditions associated with decreased expression of functional CCYPR, while CCYPR antagonists are used to treat diseases or conditions associated with decreased expression of functional CCYPR, while CCYPR antagonists are used to treat diseases or conditions associated with core confounds or so that the confound of functional CCYPR. Monoclonal or plyclonal antibodies to CCYPR may be used in enzyme-linked immunosorbent assays (ELISA) or radioimmunoasays to detect CCYPR. CCYPR itself may be used to detect compounds e.g., antibodies, oligonucleotides and proteins (receptors) that specifically bind to CCYPR. CCYPR itself may be used to dener the activity of CCYPR. CCYPR identify compounds that modulate the activity of CCYPR. CCYPR incledides can be used to generate transgenic animal models of human disease, and can be used to generate transgenic animal models of human classase, which can be disequosed, treatment or prevention of a disorder associated with CCYPR. CTYPR. CTYPR proteins, nucleic acids, agonists or antagonists include immune, developmental and cell signalling disorders, and call proliferative developmental and cell signalling disorders, asthma, cancer, allergies, allebers, mellitus, disorders of the menstrual cycle and infections
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               used to treat, diagnose and prevent immune, developmental and cell signaling disorders and cell proliferative disorders including cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

                          AAE08583
                                                                The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The choice tides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II) (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations in responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       3;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              1 MSWRGRSTYRPRPRRYVEPPEMIGPMRPEQFSDEVEPA--TPEEGEPATQRQDPAAAQEG 58

The present sequence is a human NOV4 protein. The NOVX protein has homology with one of G-antigen (GAGE)-like protein, interferon G-protein coupled receptor (GPCR), hepatocyte nuclear factor or mast cell protease. The NOVX is useful for treating or preventing a pathology associated with NOVX. It is also useful for determining the presence or amount of NOVX DNA in a sample, for identifying a potential therapeutic agent and in gene therapy. It is also useful for determining the presence of or predisposition to a disease associated with altered levels of NOVX. It is also useful for the diagnosis and treatment of proliferative disorders, e.g., cancer, immune disorders, hepatic disorders, e.g., cirrhosis, viral infections, e.g., hepatitis, neuroolfactory disease, infertility, autoimmune diseases, arthritis, multiple sclerosis, allergies and wound healing.
                                                                                                                                                           G-protein coupled receptor; GPCR; hepatocyte nuclear factor; mast cell protease; gene therapy; proliferative disorder; cancer; immune disorder; cancer; hepatic disorder; cirrhosis; viral infection; hepatitis; neuroolfactory system-related disorder; neurological disorder; Parkinson's disease; infertility; autoimmune disease; arthritis; multiple sclerosis; allergy; wound healing; cytostatic; nootropic; immunosuppressive; neuroprotective; vulnerary; hepatotropic.

The nucleic acids encoding PAGE-4 or PAGE-4 peptide fragments can also be used in these compositions. Antibodies against PAGE-4 and its peptide fragments can be used in detecting the presence of PAGE-4 and PAGE-4 coding sequences in cell samples or body tissues. The presence of PAGE-4 in tissues which are not related to reproduction can be indicative of the spread of
                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          cancerous reproductive tissue. PAGE-4 can also be used to raise antibodies which are then used as the targeting group of immunoconjugates comprising toxins used in therapeutic applications. This has applications for drug delivery systems.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Isolated PAGE-4 protein and peptide used for inducing a cytotoxic T lymphocyte response and for raising antibodies which can be used to detect the presence of PAGE-4 in cell samples or body tissues
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             PAGE-4 is a gene preferentially expressed in normal male and female

The human secreted proteins, and the polynucleotides encoding them, are predicted to have blological activities which would make them suitable for treating, preventing or ameliorating medical conditions in humans and animals. Suggested activities include nutritional activity, cytokine and cell proliferation/differentiation activity, immune stimulating activity, tissue growth activity, haematopoiesis regulating activity, tissue growth activity, haematopoiesis regulating chemotactic/chemokinetic activity, haemostatic and thrombolytic

This expression pattern makes it a target for diagnosis and for vaccine based therapy of such neoplasms.

An isolated PAGE-4 peptide which induces a cytotoxic T lymphocyte response when bound to a major histocompatibility complex (MHC) class I molecule or the isolated PAGE-4 protein can be used in immunogenic compositions to raise a cytotoxic T lymphocyte response against cells expressing PAGE-4 including cancer cells of the profitate, uterus and testis. The nucleic acids encoding PAGE-4 pottide fragments can also be used in these compositions. Antibodies against PAGE-4 and its peptide fragments can be used in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Isolated PAGE-4 protein and peptide used for inducing a cytotoxic T lymphocyte response and for raising antibodies which can be used to detect the presence of PAGE-4 in cell samples or body tissues

detecting the presence of PAGE-4 and PAGE-4 coding sequences in cell samples or body tissues. The presence of PAGE-4 in tissues which are not related to reproduction can be indicative of the spread of cancerous reproductive tissue. PAGE-4 can also be used to raise antibodies which are then used as the targeting group of immunoconjugates comprising toxins used in therapeutic applications. This has applications for drug delivery systems. This sequence is of the PAGEI polypeptide which shares sequence similarity with

The present sequence is a human NOV2 protein. The NOVX protein has homology with one of G-antigen (GAGE)-like protein, interferon, cell protean coupled receptor (GPCR), hepatocyte nuclear factor or mast cell protease. The NOVX is useful for treating or preventing a pathology associated with NOVX. It is also useful for determining the presence or amount of NOVX ban in a sample, for identifying a potential therapeutic agent and in gene therapy. It is also useful for determining the presence of or predisposition to a disease associated with altered levels of NOVX. It is also useful for determining the presence of or predisposition to a disease associated with altered levels of NOVX. It is also useful for the diagnosis and treatment of proliferative disorders, e.g., cancer, immune disorders, hepatic disorders, e.g., system-related disorders, meurological disorders, e.g., parkinson's system-related acceptor, meurological disorders, e.g., Parkinson's allergies and wound healing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             PAGE-4; MAGE; GAGE; reproduction; testis; prostate; fallopian tube; uterus; placenta; cancer; major histocompatibility complex; MHC; CTL; cytotoxic T lymphocyte; immunce response; antibody; drug delivery;

```
PAGE-4 is a gene preferentially expressed in normal male and female reproductive tissues e.g. prostate, testis, fallopian tube, uterus and placenta, as well as in prostate cancer, testicular cancer and uterine cancer. This expression pattern makes it a target for diagnosis and for vaccine based therapy of such neoplasms.

An isolated PAGE-4 peptide which induces a cytotoxic T lymphocyte response when bound to a major histocompatibility complex immorpants compositions to raise a cytotoxid T lymphocyte response when bound to a major histocompatibility complex immunogenic compositions to raise a cytotoxid T lymphocyte response against cells expressing PAGE-4 including cancer cells of the prostate, uterus and testis. The nucleic acids encoding PAGE-4 or PAGE-4 peptide fragments can also be used in these compositions. Antibodies against PAGE-4 and its peptide fragments can be used in these compositions. Antibodies against PAGE-4 and its peptide fragments can be used in tissues which are not related to reproduction can be indicative of the spread of cancerous reproduction can be indicative of the spread of antibodies which are then used as the targeting group of immunoconjugates comprising toxins used in therapeutic applications. This has applications for drug delivery systems. This sequence is coff the PAGE3 polypeptide which shares sequence similarity with
lymphocyte response and for raising antibodies which can be used to detect the presence of PAGE-4 in cell samples or body tissues
                                                                                      63pp; English
                                                                                Disclosure; Figure 1b;
